

ABSTRACT OF THE DISCLOSURE

An apparatus, method, and computer readable storage medium for dynamically maintaining data structures and executing business rules in an electronic procurement system. The method includes (a) dynamically maintaining a plurality of organizational profiles containing data structures, a plurality of users each being associated with a particular organizational profile; and (b) implementing a user requested transaction on a hosted e-procurement system with an application system by using information from the data structures stored in an organizational profile associated with the user.
